Basics of Reinforcement Learning*

by Alina Vereshchaka

*Slides are based on David Silver's course "Reinforcement Learning" and the book by Sutton, Richard S., and Andrew G. Barto. "Reinforcement Learning: An introduction (2 edition)" (2018)

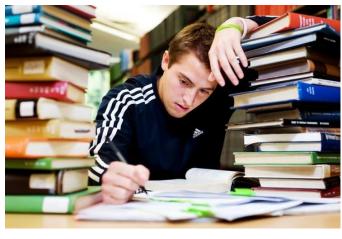

What is Reinforcement learning?

Reinforcement Learning in real world

State: tasty smell, sound

Actions: give a paw

Reward: food

State: want a good

grade

Actions: studying

Reward: good grade

State: opponent

movement, current

board state

Actions: make a move

Reward: points

Markov Chain

Definition

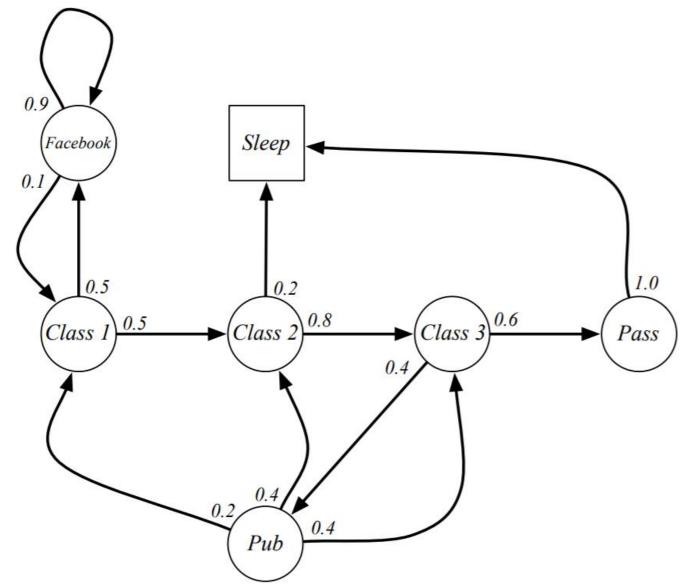

A Markov Process (or Markov Chain) is a tuple $\langle \mathcal{S}, \mathcal{P} \rangle$

- lacksquare \mathcal{S} is a (finite) set of states
- \mathcal{P} is a state transition probability matrix, $\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$

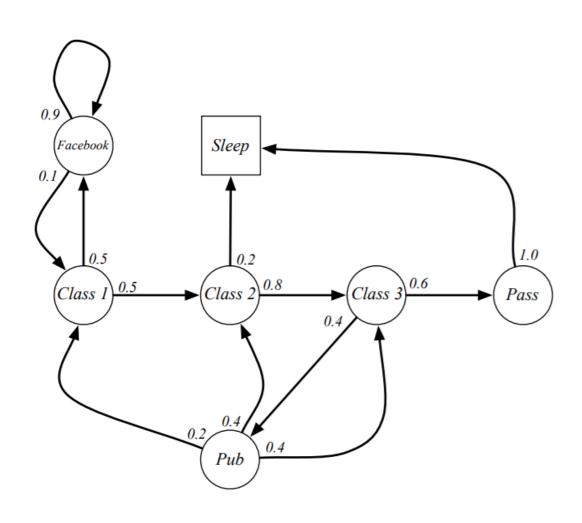

Markovian property: $\mathbb{P}\left[S_{t+1} \mid S_t\right] = \mathbb{P}\left[S_{t+1} \mid S_1, ..., S_t\right]$

"The future is independent of the past given the present"

Example: Student Markov Chain

Example: Student Markov Chain Episodes

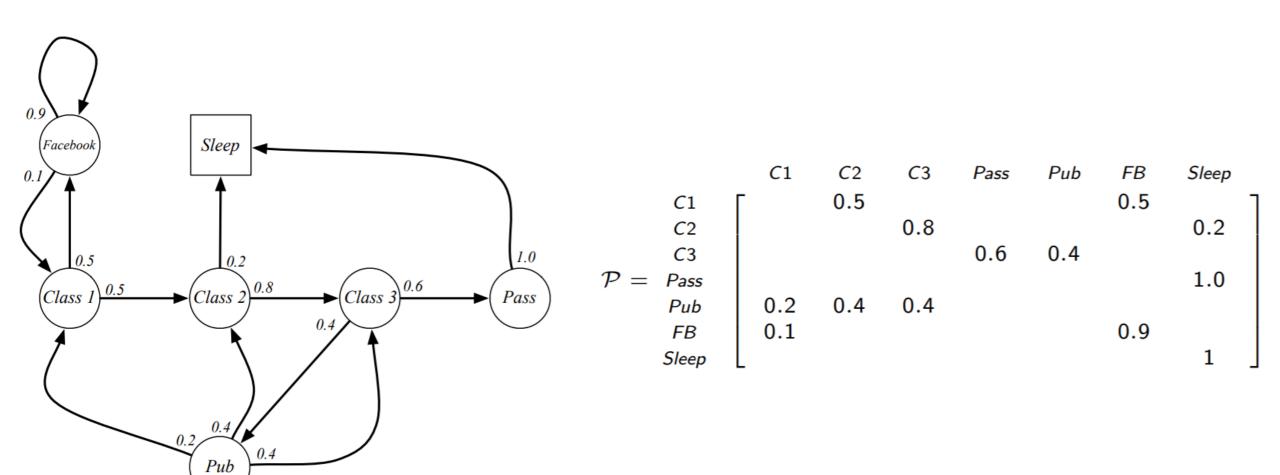

Sample episodes for Student Markov Chain starting from $S_1 = C1$

$$S_1, S_2, ..., S_T$$

Example: Transition Matrix

Markov Reward Process (MRP)

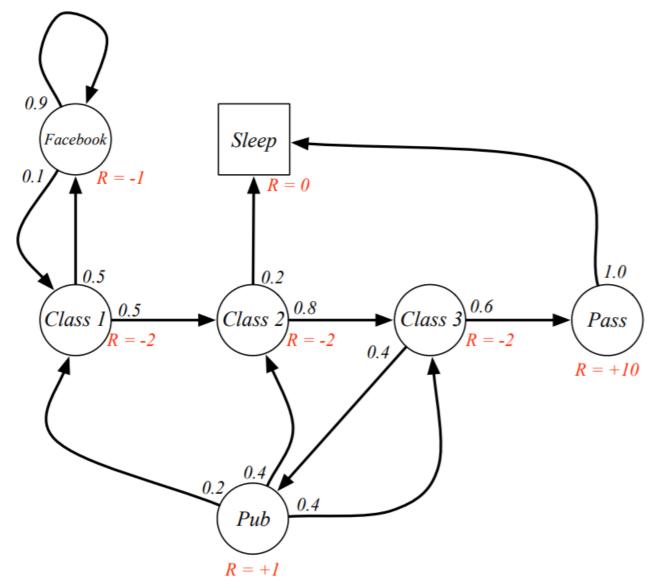

A Markov reward process is a Markov chain with values.

Definition

A Markov Reward Process is a tuple $\langle \mathcal{S}, \mathcal{P}, \mathcal{R}, \gamma \rangle$

- lacksquare \mathcal{S} is a finite set of states
- \mathcal{P} is a state transition probability matrix, $\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$
- lacksquare R is a reward function, $\mathcal{R}_s = \mathbb{E}\left[R_{t+1} \mid S_t = s\right]$
- $ightharpoonup \gamma$ is a discount factor, $\gamma \in [0,1]$

Example: Student MRP

Discounting factor \mathbf{\gamma}

The **discounting factor** $(\gamma \in [0,1])$ penalize the rewards in the future. Reward at time **k** worth only γ^{k-1}

Motivation:

- The future rewards may have higher uncertainty (stock market)
- The future rewards do not provide immediate benefits (As human beings, we might prefer to have fun today rather than 5 years later;)
- Discounting provides mathematical convenience (we don't need to track future steps infinitely to compute return)
- It is sometimes possible to use undiscounted Markov reward processes (i.e. $\gamma=1$), e.g. if all sequences terminate.

Return (G_t)

Definition

The return G_t is the total discounted reward from time-step t.

$$G_t = R_{t+1} + \gamma R_{t+2} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1}$$

- The discount $\gamma \in [0,1]$ is the present value of future rewards
- The value of receiving reward R after k+1 time-steps is $\gamma^k R$.
- This values immediate reward above delayed reward.
 - $ightharpoonup \gamma$ close to 0 leads to "myopic" evaluation
 - $ightharpoonup \gamma$ close to 1 leads to "far-sighted" evaluation

Example: Returns for Student MRP

Sample returns for Student MRP: Starting from $S_1 = C1$ with $\gamma = \frac{1}{2}$

$$G_1 = R_2 + \gamma R_3 + \dots + \gamma^{T-2} R_T$$

$$v_{1} = -2 - 2 * \frac{1}{2} - 2 * \frac{1}{4} + 10 * \frac{1}{8} = -2.25$$

$$v_{1} = -2 - 1 * \frac{1}{2} - 1 * \frac{1}{4} - 2 * \frac{1}{8} - 2 * \frac{1}{16} = -3.125$$

$$v_{1} = -2 - 2 * \frac{1}{2} - 2 * \frac{1}{4} + 1 * \frac{1}{8} - 2 * \frac{1}{16} \dots = -3.41$$

$$v_{1} = -2 - 1 * \frac{1}{2} - 1 * \frac{1}{4} - 2 * \frac{1}{8} - 2 * \frac{1}{16} \dots = -3.20$$

Value Function v(s)

The value function v(s) gives the long-term value of state s

Definition

The state value function v(s) of an MRP is the expected return starting from state s

$$v(s) = \mathbb{E}\left[G_t \mid S_t = s\right]$$

Markov Decision Process

A Markov decision process (MDP) is a Markov reward process with decisions. It is an *environment* in which all states are Markov.

Definition

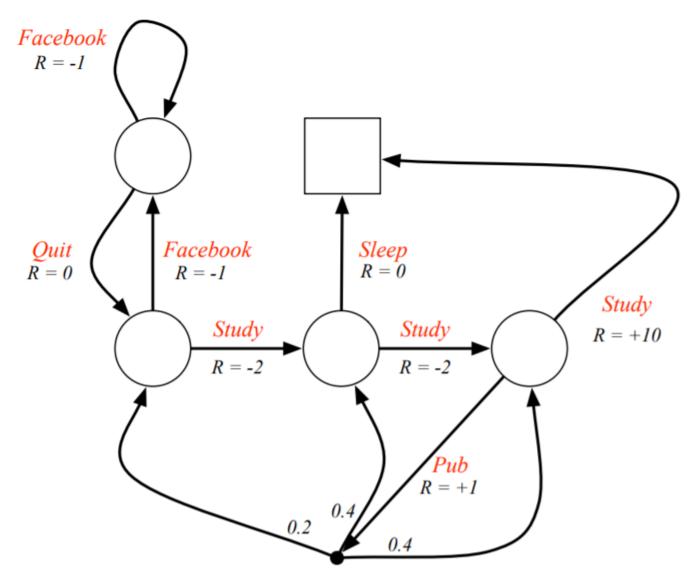

A Markov Decision Process is a tuple $\langle S, A, P, R, \gamma \rangle$

- \mathbf{S} is a finite set of states
- A is a finite set of actions
- lacksquare $\mathcal P$ is a state transition probability matrix,

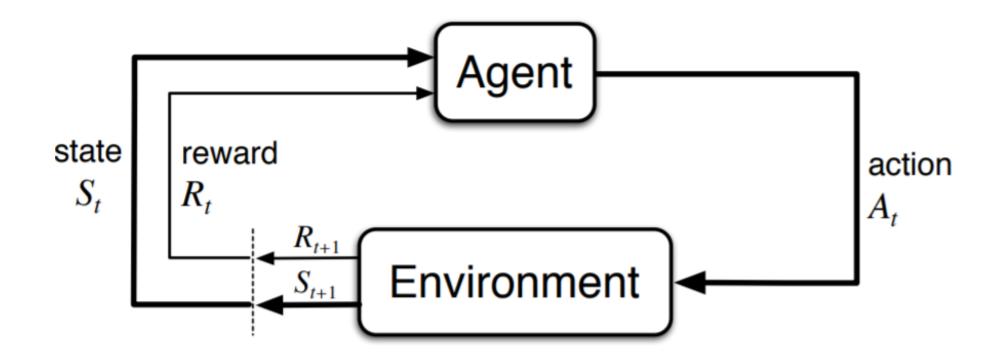

$$\mathcal{P}_{ss'}^{a} = \mathbb{P}\left[S_{t+1} = s' \mid S_{t} = s, A_{t} = a\right]$$

- \blacksquare \mathcal{R} is a reward function, $\mathcal{R}_s^a = \mathbb{E}\left[R_{t+1} \mid S_t = s, A_t = a\right]$
- γ is a discount factor $\gamma \in [0,1]$.

Example: Student MDP

Finite Markov Decision Processes (MDP)

Daily life trajectory: $S_0, A_0, R_1, S_1, A_1, R_2, S_2, A_2, R_3, S_3, A_3, ..., S_T$
